Abstract

[Replace this paragraph with a self-contained abstract. Introduce the problem, explain the gap, describe the approach, and summarize the main findings and their significance. Do not leave template instructions in the final manuscript.]

Keywords: keyword one; keyword two; keyword three

Contents

1 Introduction **3**

1.1 Contributions 3

2 Related Work **3**

3 Method **3**

3.1 Notation 3

3.2 Overview 3

4 Experiments **4**

4.1 Results and Analysis 4

4.2 Limitations 4

5 Conclusion **4**

A Supplementary Material **5**

A.1 Writing Examples 5

1. Introduction

[Describe the research problem, its importance, the limitations of existing approaches, and the objective of this manuscript. Replace all bracketed instructions with your own text.]

1.1. Contributions

- [Replace with the first contribution.]
- [Replace with the second contribution.]
- [Replace with the third contribution, or remove this item.]

2. Related Work

[Organize related work by a clear principle, summarize the relevant research, and explain the differences from your approach. Keep this discussion in its own section rather than a subsection of the introduction.]

The citations below are formatting placeholders, not real sources. Citation examples: Author (2000) and (Author, 2000). Replace the entry in `references.bib` before circulation.

3. Method

[Define the problem, notation, assumptions, and the proposed method. For a survey, rename this section and organize it around a taxonomy or argument.]

3.1. Notation

The expression below demonstrates equation numbering and cross-references; it is not a proposed method or an experimental claim.

$$\mathcal{L}(\theta) = \frac{1}{N} \sum_{i=1}^{N} \ell(f_\theta(x_i), y_i) \,. \tag{1}$$

Refer to the expression as Equation (1). Define every symbol when replacing this example.

3.2. Overview

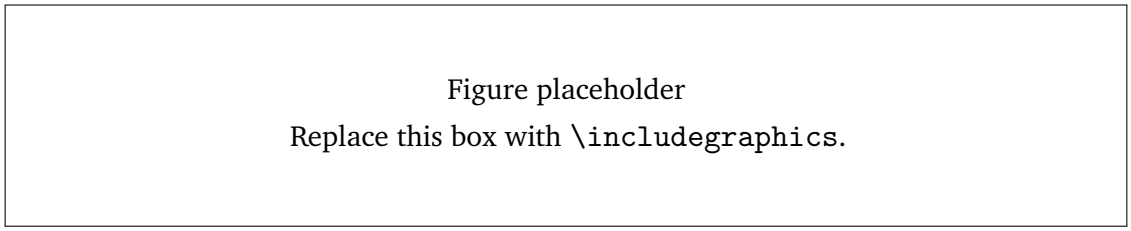

Figure 1 | [Replace with a self-contained figure caption.]

Figure 1 illustrates how figures are referenced.

4. Experiments

[Describe datasets, evaluation metrics, baselines, implementation details, comparison settings, and reproducibility information. For non-experimental papers, replace this section with an appropriate evaluation or analysis.]

4.1. Results and Analysis

Table 1 is a layout example. Dashes intentionally represent unfilled entries; no experimental results are supplied in this template.

Table 1 | [Replace with the table caption and define all metrics.]

Approach	Metric A	Metric B
Baseline	–	–
Proposed approach	–	–

4.2. Limitations

[Discuss the scope of the evidence, failure cases, assumptions, and limitations.]

5. Conclusion

[Summarize the problem addressed, the main contribution, the supported conclusions, and possible future directions. Avoid introducing unsupported claims or new results.]

Acknowledgements

[Replace with acknowledgements and funding information, or remove this section.]

References

Example Author. Reference title (formatting placeholder), 2000. Fictitious entry for template demonstration only.

A. Supplementary Material

[Add proofs, supplementary analyses, implementation details, or additional figures and tables here. Set `\LabShowAppendixfalse` in `config.tex` to omit the appendix.]

A.1. Writing Examples

These examples are generic typesetting instructions. Remove this subsection from your manuscript.

- Use `\textbf{bold text}` for **bold text** and `\emph{emphasis}` for *emphasis*.
- Use `\textcolor{LinkColor}{text}` to apply a named color.
- Use `Section~\ref{sec:method}` to refer to Section 3.
- Use `\reviewnote[AB]{Revise this paragraph.}` for an internal note. Notes disappear when `\LabShowNotesfalse` is selected.

Definition A.1 (Placeholder definition)**.** [Replace with a formal definition, or delete this environment.]

Theorem A.2 (Placeholder statement)**.** *[Replace with a theorem statement, or delete this environment.]*

Proof. [Replace with a proof, or delete this environment.] □
